Get accurate data extraction for SAP systems

Object Extractor from EPI-USE Labs allows data from thousands of supported objects to be extracted, with complete control over the output format.

Decommissioning SAP® systems is not something most people want to take on. Many companies will retain their old outdated legacy SAP systems, fearing that they would need the data for auditing or referencing in the future. This becomes very expensive. Maintenance contracts on legacy systems – together with the risk of unsupported hardware failures – result in escalating costs.

The SAP environment is also changing, and there are large incentives to move to S/4HANA® technology, or to look at SAP SuccessFactors® to leverage the cloud. Moving to different ERP systems, other than SAP, is another possibility.

Create a copy of data needed for referencing – without large costs

What if you could create a copy of the data needed for referencing without paying large overheads and running costs? Or gain access to the data grouped by business keys to feed data loads for other technologies?

This is why we have developed Object Extractor™. It allows data from thousands of supported objects to be extracted with complete control over the output format. JSON and XML formats come pre-delivered, with the option to create additional extract formats yourself, or leverage our professional services experts to do this for you. The screen options allow filtering by plant, company code, sales org, etc., and transformation can easily be built into the extraction.

What can we do for you?

Our team of experts will assist you with:
- defining the required output format
- the identification and extraction of data to move to a display-only platform or data load template
- extracting from your Production environment before moving to SAP S/4HANA or any other ERP system
- retiring an out-of-date system

The result? You will be able to access the data you need, when you need it.

Benefits:

- A tried and tested solution for extracting accurate business data
- A team of experts to guide and configure the initial extraction process
- Total flexibility in how the data is written out
- Reduced costs with no platform version dependencies to maintain

Going to S/4HANA via a Greenfield project

- Allows selection of data by an almost limitless choice of options, fiscal year, posting period or upload a list of keys from other reports
- Collects the data sets for export as a table-based output
- Matches the exact columns of the SAP Migration Cockpit template xml.

Why EPI-USE Labs?

EPI-USE Labs has data management specialists with long experience and detailed knowledge of SAP data architecture. Data Sync Manager™ is SAP certified add-on software for copying subsets of SAP Production data to non-production environments. Object Extractor sets us apart because it allows data choices to be highly selective and accurate.
